

Paramedic (PM) Test Preparation Guide

This guide is to assist those taking the Paramedic exam from the Global Emergency Medical Registry.

Exam Composition:

The exams are 100 questions in length, the questions are drawn from the GEMR test bank for the Paramedic certification levels. The exam consists of multiple choice and true/false questions. The exam utilizes Blooms Taxonomy for question development and the exams, although may vary, generally have the following makeup:

50%	Knowledge	(Recall of information, Observation, Listing, Locating, Naming) and Comprehension (Understanding, Translating, Summarizing, Demonstrating, Discussing)
25%	Application	(Utilizing and Applying Knowledge, Using Problem Solving Methods, Designing)
15%	Synthesis Analysis	(Using old concepts to create new ones, Inferring, Predicting, Combining) and (Identify the parts and explaining how the steps work together in the overall structure or purpose)
10%	Evaluation	(Evaluating outcomes, Solving, Judging, Recommending, Rating)

The Original Bloom's Taxonomy (1956)

Exam Time:

The candidate has 2 hours to complete the exam.

Exam Oversight:

GEMR requires the candidate to agree to exam oversight through an online exam Artificial Intelligence (AI) system. The system will monitor the candidate's desktop and activate the laptop or desktop computer camera.

If the Artificial Intelligence system finds the candidate behaving outside its set perimeters or accessing resources over the computer or phone during the exam, the AI will auto report this to the GEMR audit committee and stop the exam.

Thus, to sit for a GEMR exam, the candidate must have internet access, a laptop or desktop computer, and the ability to be present without interruptions for the time the exam is in process.

Question Origins:

Questions are written from the objectives listed on the "Information & Reference" tab at gemr.org

GLOBAL EMERGENCY MEDICAL REGISTRY

What Should a Candidate Review:

A candidate who completes a program of study that includes all didactic, skill, and clinical objectives listed for their certification level at gemr.org should have only light to moderate difficulty with the exam.

Should the candidate decide to study prior to taking the exam, which we highly recommend, we would suggest the candidate might wish to review the following materials:

Websites:

1. The Global Emergency Medicine Registry Blog (<https://www.gemr.org/blog/>) where GEMR provides bi-weekly updates on current science and materials. We also post longer explanations of new science and summaries of basic science concepts.
2. The Resuscitation Group Blog (<https://www.resuscitationgroup.com/blog/>), where they answer quite a few of the more in depth questions that students have inquired about recently, as well as a new science summary paper posted about every two weeks on average.
3. ILCOR Publications page (<https://ilcor.org/publications>), this can be a helpful reference for the current guidelines; please remember that current guidelines are always a year behind to allow for review of science from the previous year.
4. Circulation, the journal of the American Heart Association (<https://www.ahajournals.org/journal/circ>) has an in-depth site with multiple resources for the AHA instructor.
5. Resuscitation, the journal of the European Resuscitation Council (<https://www.resuscitationjournal.com/>) has a wide variety of resources for resuscitation science and somewhat different takes on current science than the North American view.
6. STATPEARLS (<https://www.statpearls.com/home/index>); Covering 172 medical specialties, the organization helps practitioners make the most informed clinical decisions.

Books:

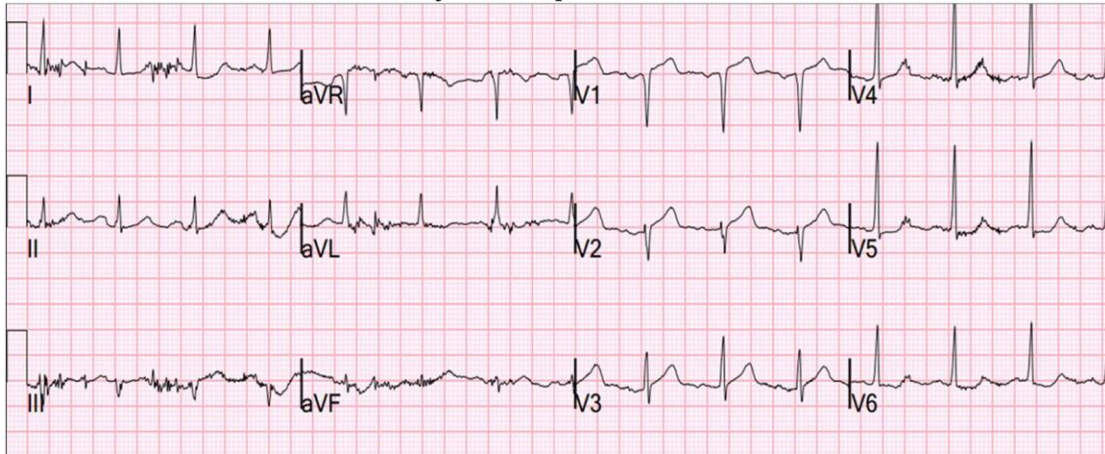

1. Emergency Medicine: The Principles of Practice 7th Edition, Kindle; Sascha Fulde MD; 2023
2. Advanced Trauma Care Program Reference Manual; Michael Christie, ATREC Inc, 2024

GLOBAL EMERGENCY MEDICAL REGISTRY

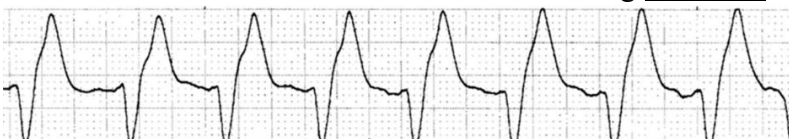

Sample Questions:

1. In the 12 lead ECG below, what is your interpretation?

- STEMI Inferior
 - STEMI Anterior
 - STEMI Septal
 - Aberrantly conducted ECG
2. You are attempting resuscitation of an infant or child with severe symptomatic bradycardia and no evidence of vagal etiology. Bradycardia persists despite establishment of an effective airway, oxygenation, and ventilation. Which of the following is the first drug you should administer?
- Atropine
 - Dopamine
 - Adenosine
 - Epinephrine
3. Your 56 year old patient, with the rhythm below, is unresponsive with the following vitals: Respiratory Rate: 24, SpO₂: 88% on room air, EtCO₂: 28mmHg with normal waveform, Temperature: 37C, BP = 80/60, Heart Rate: 100, AVPU: Unresponsive. Your next treatment should include all of the following EXCEPT?

- Airway management and oxygenation
- Vascular access and fluid resuscitation as required
- Amiodarone
- Consider hyperkalemia, type IA medication toxicity, or reperfusion arrhythmias.

GLOBAL EMERGENCY MEDICAL REGISTRY

4. Large bore venous access above the diaphragm is essential in critically ill and cardiac arrest patients for fluid resuscitation for which of the following statements best exemplify this concept?
 - a. This type of access allows for the rapid administration of resuscitative fluids and blood products directly into the central circulation and heart, making it more efficient in emergency situations.
 - b. Large bore access allows for better long-term access and infusion of medications.
 - c. Large bore would include an 18 gauge IV in the forearm.
 - d. Large bore access above the level of the diaphragm does not effect the outcome of patient in critical events.

5. Which of the following is a correct statement in relationship to the treatment of critical trauma patients?
 - a. Lactated Ringer's solution at 20 ml/kg is the most effective fluid for resuscitation in critical trauma patients.
 - b. Endotracheal intubation should be obtained in the critical trauma patient in the first moments of the event, since most patients die from airway compromise.
 - c. Studies have demonstrated that the early administration of whole blood in the prehospital phase can significantly benefit trauma patients with hemorrhagic shock.
 - d. Spinal immobilization is the gold standard for the initial approach to the critical trauma patient.

6. A patient care _____ is a document that is used to record the essential elements of patient assessment, care, and transport.
 - a. report
 - b. statement
 - c. document
 - d. information file

GLOBAL EMERGENCY MEDICAL REGISTRY

7. Your patient is a 66 y/o, 100 kg, male who was complaining of severe chest pain (8/10) when he went into cardiac arrest. After 20 minutes of cardiac arrest management, you have succeeded in converting the patient to an organized rhythm from ventricular fibrillation. During arrest management, you obtained a 14g IV in right antecubital fossa, intubated with a 7.5 ET Tube and ventilated at 10 bpm with 500 ml of volume per breath, six shocks were delivered (3, anterior-lateral and 3, Dual Sequence External Defibrillation) and the patient received 300mg Amiodarone. Currently the patient has returned circulation with the following vitals: GCS 3, BP: 65 mmHg MAP, Respiratory rate 10 via BVET, Pulse 86 in Sinus Rhythm with ST Elevation in seven leads on 12 Lead ECG. What is your next appropriate intervention?
- Fluid challenge to improve MAP and draw labs for further review.
 - Switch patient to an epinephrine infusion at 20 mcg/min to improve MAP.
 - Increase ventilatory effort to 20 bpm and administer 150 mg Amiodarone IV infusion.
 - Sedate patient with Ketamine and transport for immediate angiography and percutaneous coronary intervention
8. In cardiac arrest, quantitative waveform capnography is used for which of the following:
- Confirm tube placement
 - Assess quality of CPR
 - Identify ROSC
 - All of the above
9. Which In the patient using their normal negative pressure ventilation physiology, the HeringBreuer reflex is responsible for which of the following actions?
- Inhibits expiration to prevent excess carbon dioxide elimination
 - Terminates inhalation to prevent overexpansion of the lungs
 - Controlling voluntary breathing through the cerebral cortex
 - Influencing the rate of respirations per minute
10. Your patient is a 30 y/o female who was intubated and is now ventilated every 3 seconds with a volume of 700ml. Her minute ventilation is:
- 7,000 ml
 - 10,000 ml
 - 14,000 ml
 - 20,000 ml

Sample Question Answers:

1. C

There is STE in V1 and V2, and ST depression in I, aVL, V5, and V6. Is it normal variant STE? Or is it anterior STEMI? ST depression in the lateral leads should not be seen in normal variant STE. Because of this ST depression, STEMI should be diagnosed until proven otherwise, and the STE equation should not be used; if it were used, with $STE_{60V3} = 2$, $QTc = 412\text{ms}$, $RAV4 = 20\text{mm}$, the value would be 20.18 {less than 23.4 would indicate normal variant}. The equation is falsely negative because most of the ischemia is in the septum, not the anterior wall, so that STE in V3 is not high and R-wave amplitude in V4 is not affected.
2. D

Sarah M. Perman, MD, MSCE, FAHA, Vice Chair, et Al. 2023 American Heart Association Focused Update on Pediatric Advanced Life Support: An Update to the American Heart Association Guidelines for Cardiopulmonary Resuscitation and Emergency Cardiovascular Care. *Circulation*, Volume 149 • Number 5 • 30 January 2024, Pages: e254 - e273. PubMed: 38108133.
3. C

Wide complex tachycardia treated as VT has a long history of poor outcomes; the initial study in this area of inquiry was “Treatment of “slow VT” may induce asystole”; McLean, et al; *Ann Emerg Med*, 2000. When the rhythm is wide and less than 150, it is very unlikely to be VT and when less than 130 is NOT V-Tach
4. A

Large bore venous access above the diaphragm is essential in critically ill and cardiac arrest patients for fluid resuscitation. This type of access allows for the rapid administration of resuscitative fluids and blood products directly into the central circulation and heart, making it more efficient in emergency situations (Kirkpatrick, 2023; GEMR Blog “Why large bore venous access above the level of the diaphragm is critically important in critically ill and cardiac arrest patients for fluid resuscitation.”
5. C

Studies have demonstrated that the early administration of whole blood in the prehospital phase can significantly benefit trauma patients with hemorrhagic shock (Mapp et al., 2020; Rangrass, 2022; Shackelford et al., 2021). GEMR Blog, “Why whole blood is the best volume for critically ill trauma patients in the prehospital setting?”
